X2 Tracker.

UNIQUE X2 TRACKER

The X2 Tracker opens new possibilities to observe, control and manage the track. With a view on the real-time positions of the vehicles on the track everybody in Race Control will be able to follow the action. Serving different purposes for different persons, the X2 tracker will definitely improve the racing experience.

- See the action happening on the track, real-time without any delays.
- Filter on start numbers. Hide/highlight all start numbers.
- Shows missing vehicles on track
- Perfect tool for Race control, Race director and other people in the Race Control.

IMPROVED TRACK CONTROL

During track activities race control depends on visual and audio systems to stay informed about any (sport) incidents on the track. These safety systems are important for observing and guarding the safety on track from Race Control but do have limitations in providing important information.

Especially when it comes to determining specific information like start numbers or following/searching a car around the track the X2 Tracker is a proven addition for Race Control to existing safety systems. It's functions are very advantageous for track days and race events.

SAFETY FIRST WITH X2 TRACKER

The X2 tracker allows Race Control to better observe the track and react to situations. The tracker shows a fluent animation of the position of the vehicles on the track. Follow or locate specific participants on track or in the pit lane. With the tracker you have the situation on track clearly visualized in front of you.

With the purpose of helping Race Control in guarding safety the X2 Tracker also warns for missing vehicles; participants who didn't reach the next expected measurement point. Race Control can take immediate action when any vehicle is missing.

DEVELOPED FOR X2

The X2 Tracker, as the name already states, is specially developed and designed for the Mylaps X2 timing system. By connecting directly to the X2 server any delays in the animation of the vehicle position are automatically eliminated. The X2 tracker functionality depends on the information and loop data available in the X2 system. The more loops available in X2 the more accurate the vehicle positions will become and results in even more benefits to Race Control.

The X2 Tracker also downloads any available competitor information from the X2 like transponder numbers and start numbers to show in the Tracker. This information can be important to both Race Control as Race directors in guarding the track and sport behaviour on track. Here again, the more information available in the X2, the better the Tracker functions.
